

CS131 Week 6

Week 6 Lecture 1

*2nd half of lecture

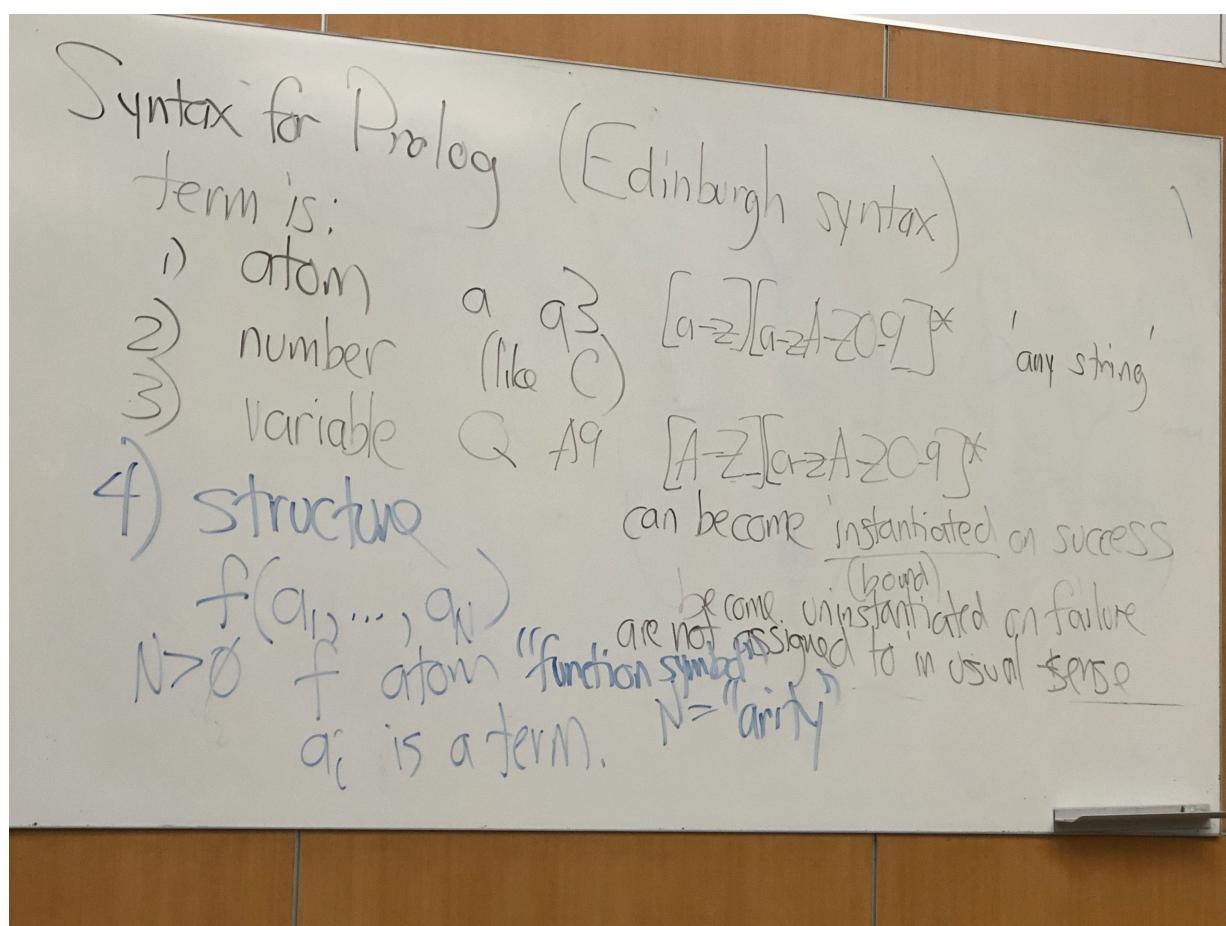

Syntax for Prolog (Edinburgh syntax)

Term is:

1. atom
2. number
3. variable
4. structure

"function symbol"

N = "arity"

is/2 1st arg: number
 2nd arg: arithmetic expression

equals($\text{sin}(0)$, 0). +'(3,5)

$\text{sin}[\varnothing]$

$+\boxed{3}\boxed{5}$

?- is(4, +'(2,2)).

$+\boxed{2}\boxed{2}$

?- is(N, +'(2,2)).

N=4.

ground term: a term that doesn't contain any (logical) variables

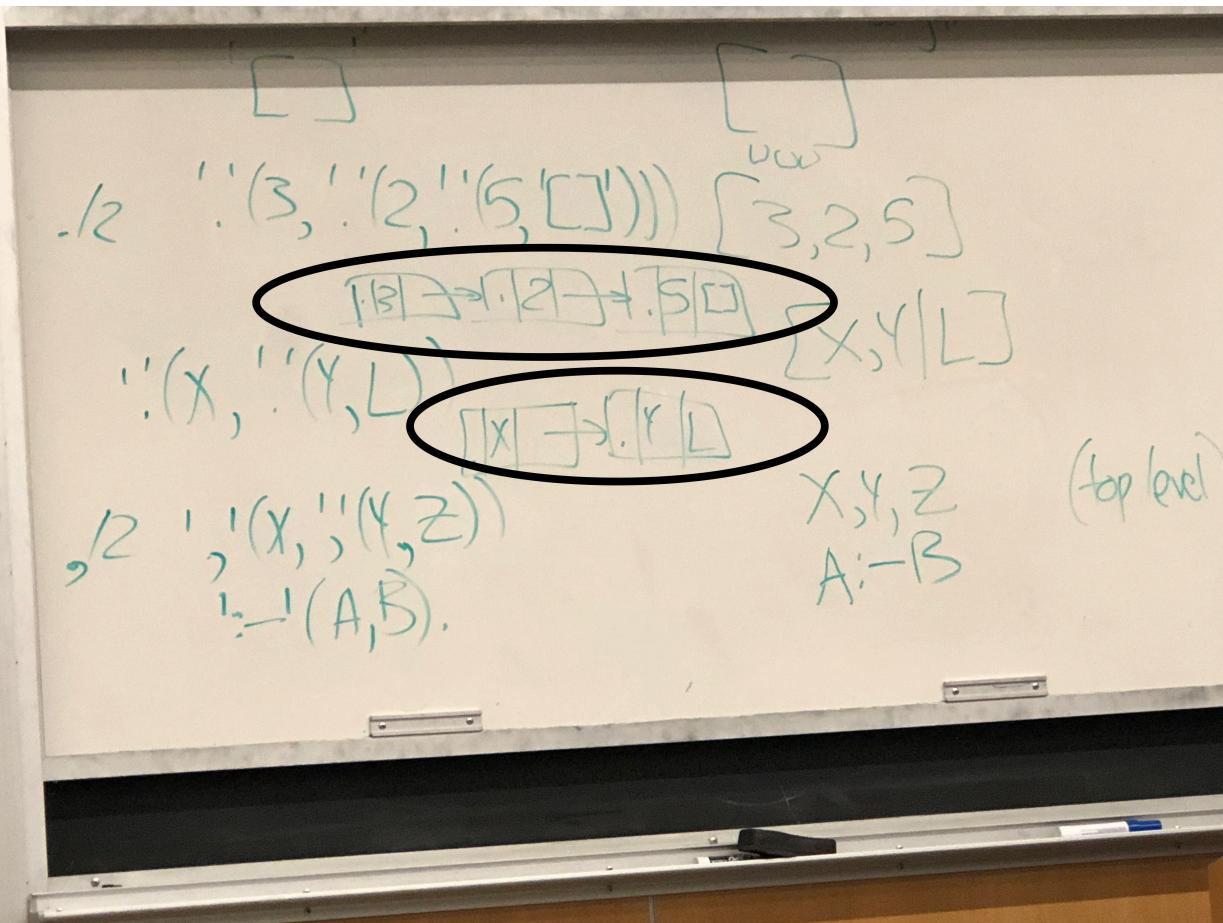

?- is(1369, '*'(N, N)) <= problem: * (N, N) expects two numbers, but gets N

'+' (2, 2)

?- is(N, +' (2, 2)).

Prolog syntactic sugar hints:

Core syntax	Syntactic Sugar
'[]'	[]
./2 '!' (3, '!' (2, '!' (5, '[]')))	[3,2,5]
'!' (X, '!' (Y, '[]'))	[X, Y L]
,/2 '!(X, '!(Y,Z))	X, Y, Z

Ending notes:

Non-associative operators

- :- // turnstyle

- = // equals

i.e. can't do `a :- b :- c :- d`

Unbound variables

Not known what the value is equivalent to

Can fill the unbound variables later

?- X = Y,

Y = 2

\wedge X, Y both unbound, bound to each other

\wedge Y and X now both 2

$=X, =([1, 2])$
~~d + a~~ ?- $X = ([Y | 12])$

 $X = ([Y | 12])$

Predicate Examples

`append([], L2, L2).`

`append([H1|T1], L2, [H1|TRes]) :- append(T1, L2, TRes).`

% prefix L=[1,2,3,4,5]. so anything from [] , [1] , [1,2] , [1,2,3] , [1,2,3,4] , [1,2,3,4,5] will be a yes

`prefix_(P,L) :- append_(P,_,L).`

`suffix_(S,L) :- append_(_,S,L).`

`dot([H1],[H2],HRes) :- HRes is H1*H2.`

`dot([H1|T1],[H2|T2],Res) :- HRes is H1*H2,`

`dot(T1,T2,TRes),`

`Res is HRes+TRes.`

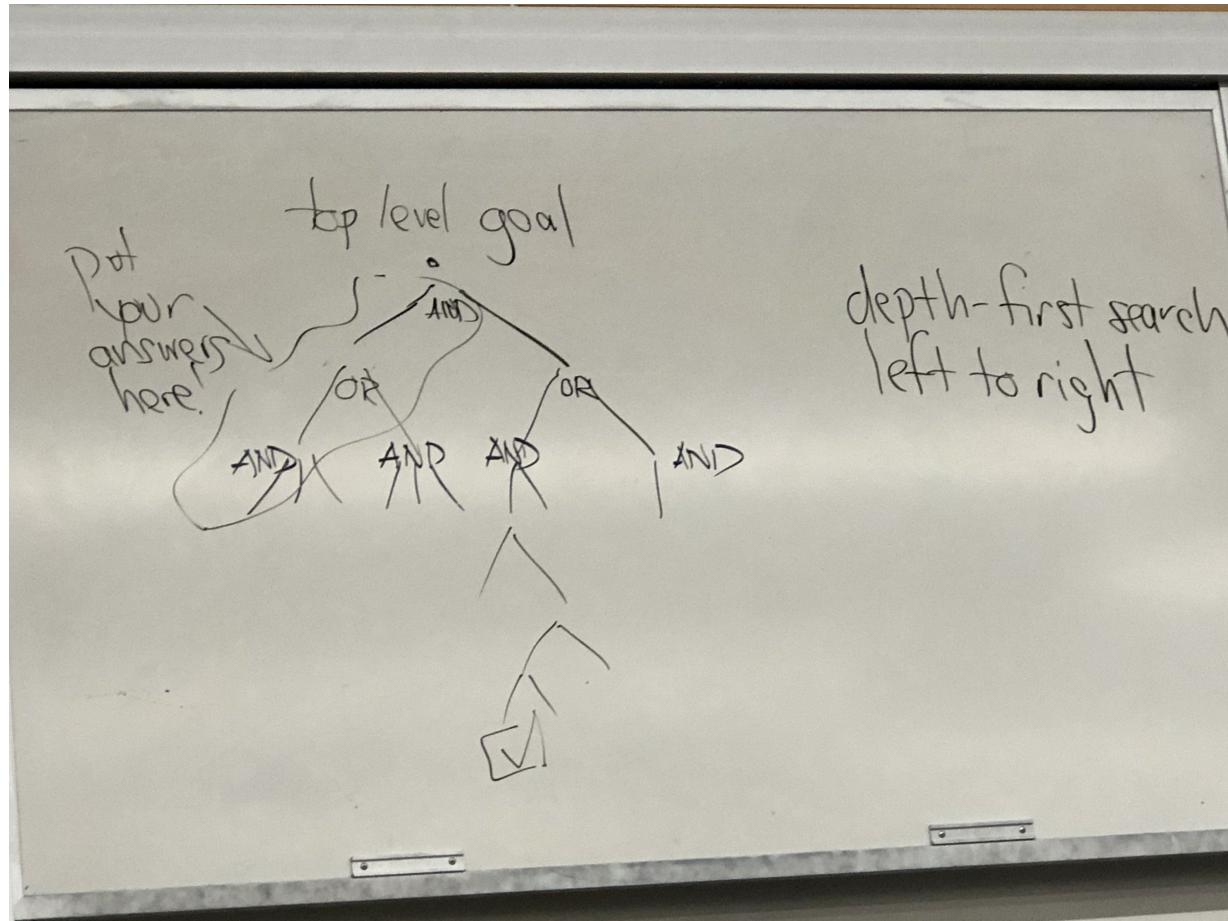

slow-reverse([], []).
 slow-reverse([X|L], R) :- *(naive reverse)*
 !, L = [X|_].
 slow-reverse([X|L], R) :- slow-reverse(L, L1), append(L1, [X], R).
 reva([], A, A).
 reva([X|L], A, R) :- reva(L, [X|A], R).
 reverse(L, R) :- reva(L, [], R). *(cost of append(A, B) is |A|)*

— 2/13/18

Week 6 Lecture 2

More Prolog!

- Facts are terms, no **logical connectives**
 - pr (cs32, cs131)
- Rules can use ':-' 'if' 'and'
 - tcpr(A, B) :- pr(A, B)
 - tcpr(A, Z) :- pr(A, B), tcpr(B, Z)
- Queries (goals) ?- pr(A, B), tcpr(B, A). can use AND

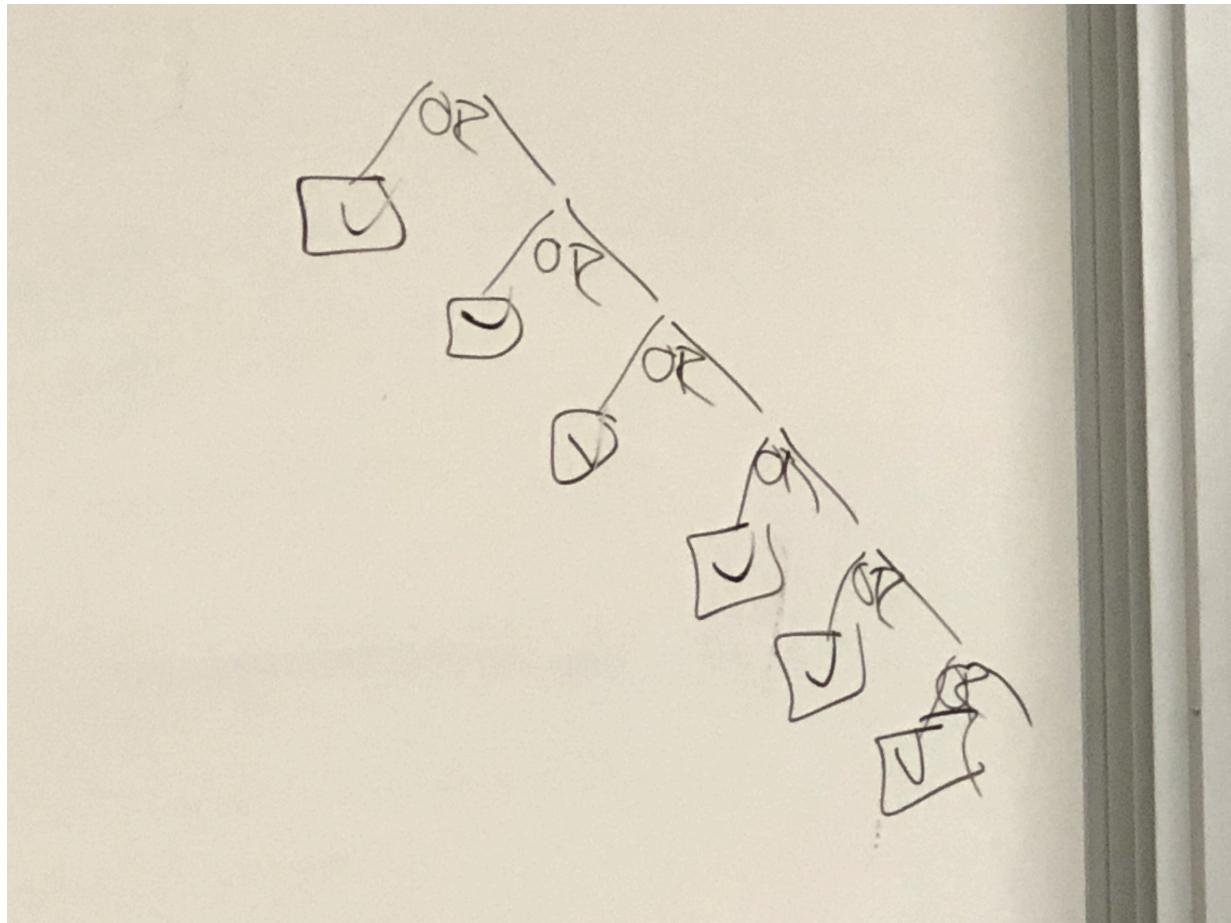

repeat.

repeat :- repeat

?- repeat.

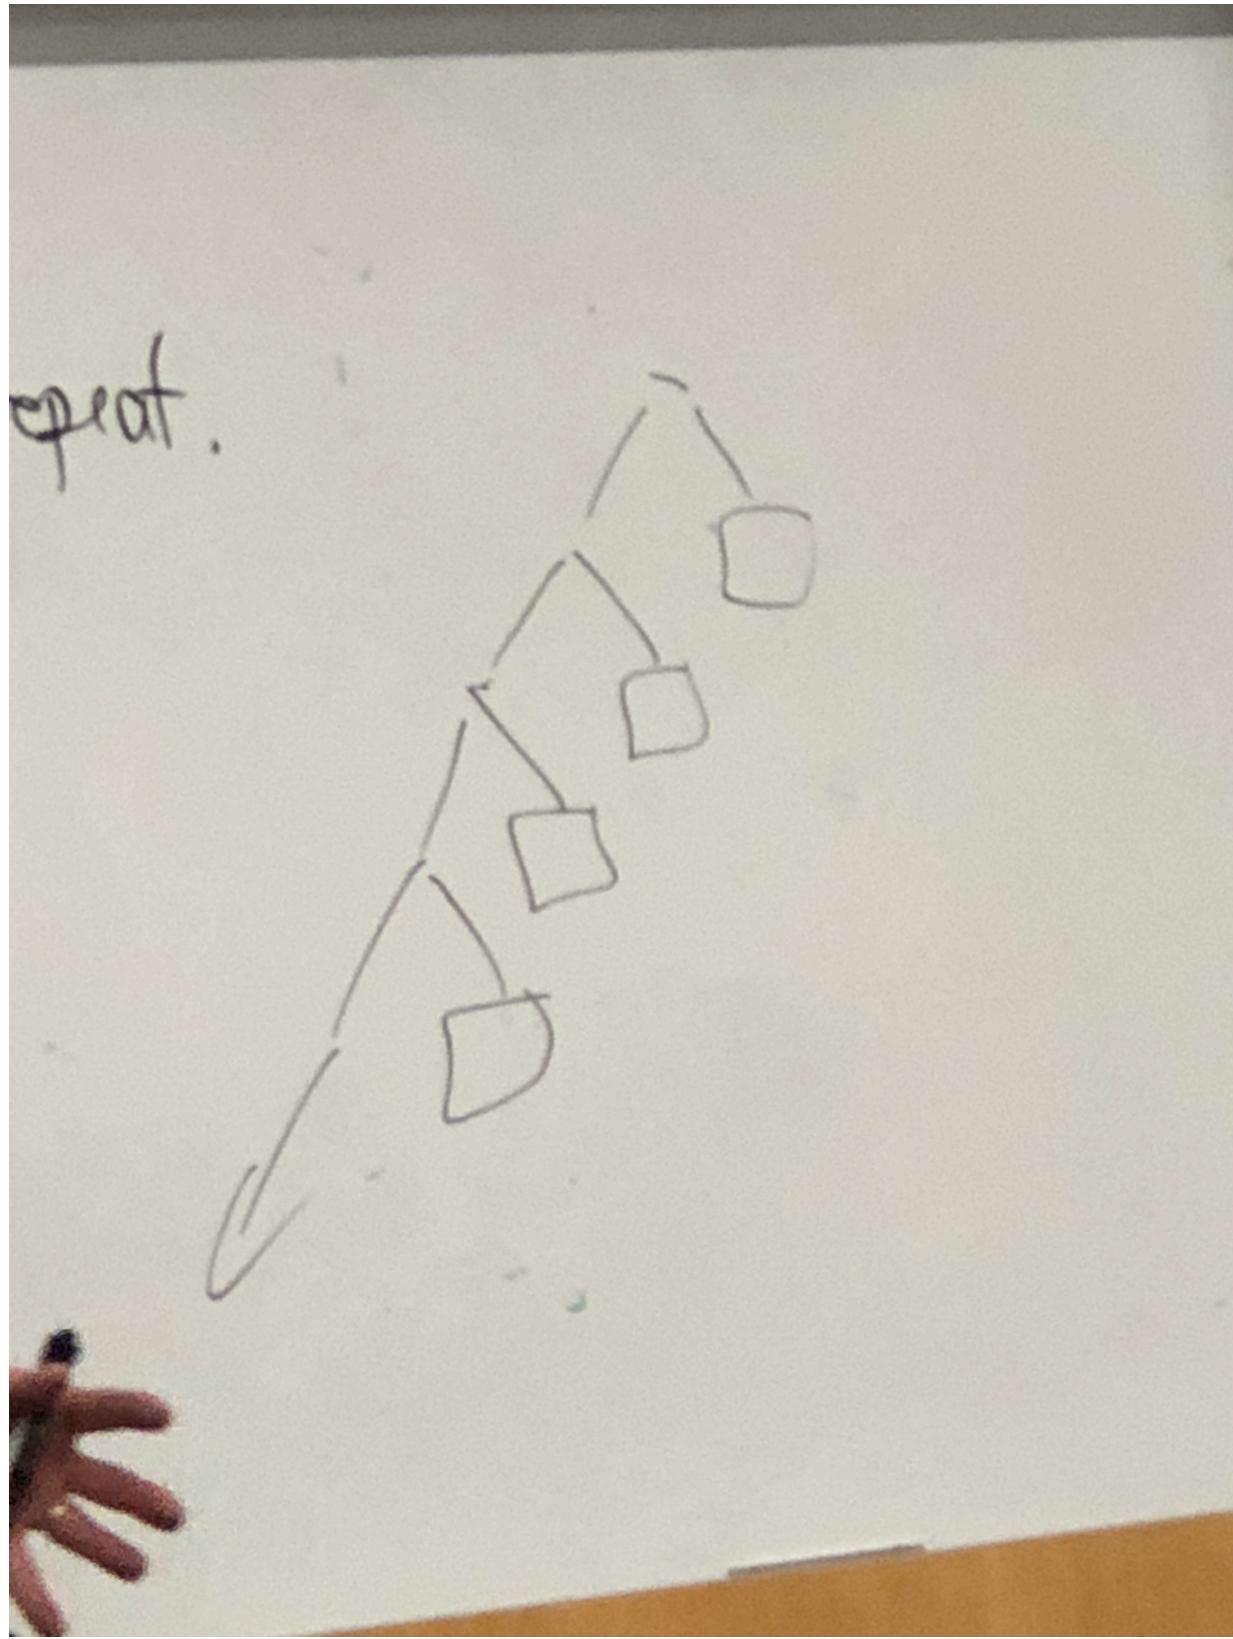

yes

?- repeat, newline, fail.

badrepeat :- badrepeat.

badrepeat.

Debugging

- simplest way to debug is to **print**
